How to Tell if You Have Hard Water

Hard water is one of the most difficult water problems to identify. Often the issues aren't recognizable until its too late .

Although it is difficult to see, taste, or smell the problems of hard water, there are minute signs you can pinpoint. You may feel the effects of hard water on your hair, skin, and nails; signs such dryness, brittleness, and skin irritation will be more prominent. When it comes to "seeing" hard water, it doesn't typically leave obvious staining, like other contaminants. You will likely notice spots on your dishes and shower doors/glass, you may also notice your laundry appears faded and feels stiff . Another sign of hard water that isn't easy to spot is build-up in your plumbing. This issue can cause low water pressure, plus can decrease the efficiency and lifespan of your water-using appliances.

If you are looking for a long-term solution, the most dependable answer is a water softener. Water softeners attract, trap, and flush out the unwanted minerals in your water, providing you with clean, soft water.

The first step is as easy as finding a good time schedule a professional water test. One of our water experts can analyze your water in about 30 minutes in the convenience of your own home. With a Culligan water test you can expect:

- **Expertise:** Our representatives have extensive experience in providing you with practical solutions for your water concerns
- **Flexibility:** Schedule a water test at your convenience and water tests can be completed for both municipal & well water
- **Convenience:** A complimentary water test is quick and easy way to learn about your water while a professional handles the hard work
- **Context:** Your local expert can help you understand how each issue may be interconnected or worsening each other
- **Recommendations:** After your test, you and your water specialist can choose the best personalized water treatment solution for your needs
- **Additional Information:** In addition to hard water, Culligan's in-home water test checks chlorine, TDS, iron, pH, and more (A separate lab test is available for concerns like PFAS, lead, bacteria, and other contaminants)

Provided that you have identified some of these hard water issues in your home, the simple solution is to have a water expert perform a test. The representatives test your water right in front of you, determine whether you have any water problems and provide you with their results and recommendations for a solution if needed.
